

Arthrogram

Risks and side effects

Complications are rare during this procedure however you should be informed of the possible risks and side effects.

Risks associated with this procedure include:

- Pain or discomfort at the needle insertion site, or bruising after the procedure.
- Vasovagal reactions (feeling faint) can cause dizziness or result in temporary loss of consciousness and may be delayed (several minutes after the procedure). This is most common in young, fit patients. Please inform us if you feel dizzy at any stage.
- Infection is rare but may involve redness or swelling and increased joint pain, usually after 48 hours. Superficial infection is the most common form and responds rapidly to antibiotics; joint infection is very rare but can be severe and associated with permanent joint damage.
- Risks associated with X-ray contrast and local anaesthetic injections include nausea and mild reactions such as rash or itching. Severe allergic reaction is rare and life threatening reactions even rarer.

Any medical procedure can potentially be associated with unpredictable risks.

If you experience any side effects please call us on 6382 3888 or contact your GP.

If you are still concerned and it is after hours please contact your nearest Emergency Department.
